

Device for radio meters and heat cost allocators

STWB

Wireless readings through Tablet

The Walk-By Sitec system allows reading the M-Bus radio meters in a simple and reliable way.

Using a tablet supplied by Sitec with the App "Walk-By Sitec" installed, you can receive the data consumption values of a building with no need to enter, thanks to the radio receiver assembled in the device.

What distinguishes this system is the ease of use, in fact, it has been developed to be used even by less experienced staff.

This system allows a great flexibility in the readings. In fact, it is possible to receive data from all the radio meters detected or load a previously saved list and display only consumption values of the desired devices. You can also add or remove devices to the list according to your needs (for example in case of replacement of the measurement device).

The consumption values of the meters, once reading is completed, are saved within the tablet, ready to be accessed or processed with standard programs such as Excel or equivalent.

"Walk-By Sitec" also is a secure system, which allows data encryption, to prevent unwanted devices from reading the consumption values of housing units.

PRODUCT CODE

STWB-KIT-01

Tablet with USB radio interface for reading radio meters and heat cost allocators
